## Lab 6 Andrade

February 18, 2024

```
21 Febuary 2024 # Lab 6 Assignment - CS 4315 Doug Andrade
```

1. Load the SMS file into a pandas dataframe using tab delimiters.

```
[1]: Label

O ham Go until jurong point, crazy. Available only ...

1 ham

Ok lar... Joking wif u oni...

2 spam Free entry in 2 a wkly comp to win FA Cup fina...

3 ham U dun say so early hor... U c already then say...

4 ham Nah I don't think he goes to usf, he lives aro...
```

```
[2]: # Create binary label version for follow-on correlation analysis (1 = spam)
spam_binary = spam_df
spam_binary['Label'] = spam_binary['Label'].replace({'ham': 0, 'spam': 1})
spam_binary.head()
```

```
[2]: Label SMS 0 0 Go until jurong point, crazy.. Available only ...
```

```
1
                               Ok lar... Joking wif u oni...
       1 Free entry in 2 a wkly comp to win FA Cup fina...
3
       O U dun say so early hor... U c already then say...
       O Nah I don't think he goes to usf, he lives aro...
```

## 2. Use lemmatization to create count vectors for each SMS message.

```
[3]: # Import CountVectorizer for conversion of text to a token count matrix
     from sklearn.feature_extraction.text import CountVectorizer
     # Import word tokenize for dividing strings to list of substrings
     from nltk import word tokenize
     # Import WordNetLemmatizer for reducing words to base form
     from nltk.stem import WordNetLemmatizer
     # Import search() to search for specific regular expressions
     from re import search
     # Create a custom tokenizer with lemmatization
     class LemmaTokenizer:
         def __init__(self):
             # Initialize the word reduction function
             self.wnl = WordNetLemmatizer()
         def __call__(self, doc):
             # Regular expressions filter for numeric characters and short words
             regex_num_punctuation = '(\d+)|([^\w\s])'
             regex little words = r'(\b\backslash w\{1,2\}\b)'
             # Tokenize and lemmatize tokens not in the regular expression filter
             return [self.wnl.lemmatize(t) for t in word tokenize(doc)
                     if not search(regex_num_punctuation, t) and not
                     search(regex_little_words, t)]
     # Initialize the text to token matrix function with lemmatization
     text2vec_lemma = CountVectorizer(tokenizer = LemmaTokenizer(),
                                      stop_words = ['english', 'ha', 'le', 'wa'],
                                      lowercase = True)
     # Apply the text vectorizer and lemmatization to the data frame's "SMS" column
     text2vec_lemma.fit(spam_binary['SMS'])
    /home/drandrade/anaconda3/lib/python3.11/site-

```

## 4. Find the nearest neighbor to "I know that!" using Euclidean distance.

```
The shape of the new Pandas dataframe is: (5572, 6624)
The shape of the vectorized Numpy array is: (5572, 6623)
The shape of the example vector is: (1, 6623)
```

The nearest Euclidean neighbor to "I know that!": 0: "Ok.."

5. Finding the nearest neighbor to "I know that!" using cosine distance.

The nearest cosine neighbor to "I know that!": 0: "I know that my friend already told that."
